

Road & Route Hazard Assessment Service (RHA)

Importance of RHA

Many companies in Pakistan rely heavily on land transport for their business. These include people movement, equipment movement as well as material movement. Therefore all routes and roads travelled should be assessed for hazards and those inherent risks that would adversely affect the success of a journey should be controlled.

OSALP International competent team would perform the following activities....

Hazard Type

for each KM

Driving surface width and integrity, potential collision objects, road intersections, Road furniture, History of vehicle accidents or traffic conflicts are all recorded . A mobile signal strength is measured and recorded also at each kilometer

Risk Ranking

Low, medium, high risks

The risks and all preventive and mitigation controls measures are identified. Alternative lower risk routes are recommended whenever possible in preference of those with a higher risk ranking. Driver age, vehicle condition and hours of operations are also taken

Escalation Factors

Fog, smog, smoke, poor drainage/frequent mud, snow and ice, shadowed areas crosswinds, weight restrictions (road/bridges), sun, road surface when wet, low illumination, driver experience, conflicting priorities, rain,

OSALP team travel along the same route and sometimes in the same vehicle for Road Hazard Assessment
